Submitting your electricity use from your OWL USB+ Energy Monitor

You can read your electricity consumption data directly on your OWL Energy Monitor. This is measured in kWh.

This guide explains how to download and send your energy consumption data to Anthesis for inclusion in your energy survey report.

Step 1: Download the Software

On your pc or laptop go to the following website: <http://theowl.com/downloads.html> and download the latest software for your OWL. The links to software downloads can be found on the right hand side of the screen.

Next install the software following the software user guide within the downloaded ZIP file. Follow the 'Getting Started' section of the Software User Guide, to get the new hardware installed, and to add the USB as a "Connected To" device in the software

Step 2: Connect Your OWL to your PC

Next connect the mini-USB port of the monitor to the PC using the USB cable provided with your OWL. If you have lost it, then any USB cable should do.

When this is done the last 30 days data (or number days data stored if less than 30 days) will automatically download to the OWL USB Connect2 database.

Step 3: Download Every 30 Days

Try to download data at least every 30 days to ensure that all your data is stored on your PC and can be sent to us for analysis. If 30 days is exceeded since last download, then the data for the days between the last 30 days and last download of data will be overwritten in the monitor, hence there will be no data saved for those days in the database.

Step 4: Email Your Data

Email your data to IoSBusinessEnergy@anthesisgroup.com when requested.
